

GrantLens

External Testing Guide

Team AIC026 · AI Challenge · For markers and external testers

This guide explains how to install, start, and test GrantLens on the web UI. The product interface is English-only. Button labels below match the live app.

1. Package layout (paths)

After unzipping the submission, open the folder that contains **README.md**, **backend/**, **frontend/**, and **data/**. That directory is the application root (often named **grantlens** inside **Grantlens - Team AIC026**). All commands below must be run from this application root.

- **README.md** — install / run / test overview
- **requirements.txt** — Python dependencies
- **backend/** — FastAPI application
- **frontend/index.html** — single-page UI served at /
- **data/** — rulesets, demo applications, labels, screening lists, officers
- **docs/System pipeline.html** — system diagram (open in a browser)
- **docs/GrantLens-External-Test-Guide.pdf** — this guide
- **tests/** — optional automated checks
- **_install_ollama.py** — download/install Ollama via official HTTPS + pull **qwen3:8b**
- **_start_ollama.py** — start GrantLens with the real Ollama model
- **_start_server.py** — optional start in mock mode (no Ollama)

2. What you are testing

GrantLens is a human-in-the-loop assistant for grant eligibility screening. For each criterion it drafts a verdict with verbatim citations; an authenticated officer must confirm each line and sign before any adverse letter exists. AI never auto-approves an application.

3. Prerequisites

- Python 3.10+ (3.12 recommended)
- Unzipped application root (see section 1)
- For real AI assessment (recommended for markers): Ollama installed, plus model **qwen3:8b** (5 GB download; GPU recommended)
- For UI / workflow-only testing: mock mode (no Ollama, no GPU)

4. Install and start

4.1 Install Python dependencies

```
cd grantlens
python -m venv .venv
# Windows PowerShell:
.venv\Scripts\Activate.ps1
# Linux / macOS:
# source .venv/bin/activate
pip install -r requirements.txt
```

4.2 Option A — Run with Ollama (real model)

Use this path to evaluate the live assessment pipeline. Application data stays on the local machine; the model is served by Ollama on **localhost:11434**.

Step 1 — Install Ollama + pull the model (helper script)

From the application root (venv activated, network available), run the helper that downloads only from official HTTPS endpoints on **ollama.com** and then pulls **qwen3:8b**:

```
python _install_ollama.py
# Windows: you can also double-click _install_ollama.bat
```

The script asks for confirmation before installing. On Windows it uses <https://ollama.com/install.ps1> (fallback: `ollamaSetup.exe`). On macOS/Linux it uses <https://ollama.com/install.sh>. First model pull is several GB and can take several minutes. Manual alternative: install from <https://ollama.com>, then `ollama pull qwen3:8b`.

Step 2 — Start GrantLens against Ollama (from the application root, venv activated):

```
# Recommended helper (sets GRANTLENS_LLM=ollama and MODEL=qwen3:8b)
python _start_ollama.py

# Equivalent manual commands — Windows PowerShell
$env:GRANTLENS_LLM = "ollama"
$env:GRANTLENS_MODEL = "qwen3:8b"
uvicorn backend.app:app --port 8000

# Linux / macOS
GRANTLENS_LLM=ollama GRANTLENS_MODEL=qwen3:8b uvicorn backend.app:app --port 8000
```

Step 3 — Confirm in the browser

- 1 Open <http://127.0.0.1:8000> (or <http://localhost:8000>). Keep both Ollama and the GrantLens terminal running.
- 2 Sign in (section 5). There must be no yellow MOCK mode banner.
- 3 Left sidebar should show AI core qwen3:8b (or your chosen model) and a green “model ready” style status when healthy.
- 4 Open a case → click Run AI assessment (...). Expect ~8–10 seconds per criterion on a typical GPU; many criteria means several minutes.

If assessment fails with connection / model errors: confirm Ollama is running, `ollama list` contains the model, then restart GrantLens. Do not leave `GRANTLENS_LLM=mock` set in the same terminal session.

4.3 Option B — Mock mode (UI / workflow only, no Ollama)

Verdicts are simulated and labelled MOCK in the UI. Use this when you only need login, queue, review, and countersign. Do not report mock scores as model performance.

```
# Windows PowerShell
$env:GRANTLENS_LLM = "mock"
uvicorn backend.app:app --port 8000

# Or:
python _start_server.py

# Linux / macOS
GRANTLENS_LLM=mock uvicorn backend.app:app --port 8000
```

5. Demo accounts

Username	Password	Role	Use for
sarah.mitchell	demo-officer-123	officer	Review cases, confirm criteria, sign off
david.thompson	demo-manager-123	manager	Countersign; approve criteria/labels

Table. Demo accounts in `data/officers.json`.

Use Sign out (top-right) before switching roles. Identity always comes from the session — the UI cannot impersonate another officer by typing a name.

6. UI map — left navigation

After login, the dark left sidebar is the main menu. You can also press keys 1–6 (when not typing in a field).

Key	Sidebar label	What to check on screen
1	Overview	Tiles (queue counts), optional post-audit card, short application table, MOCK banner if mock mode
2	Application	Full queue: ID, applicant, organisation, criteria set, scenario, status, officer
3	Criteria sets	Dropdown of funds; guard coverage; measurement status; generate/approve test set (manager)
4	Bias Lab	Pick pair A/B (e.g. HS-04A vs HS-04B) → Assess & compare
5	Audit log	Filter by case; hash-chain status; actor + role on each event
6	Data intake	Upload application; Sanctions/ABN lookup; letter template; extract criteria preview

Table. Sidebar screens and what “good” looks like.

Top bar shows the signed-in name, role chip (officer / manager / auditor), and Sign out. Page title updates when you change screens.

7. Step-by-step UI checklist

Follow in order. Exact button labels are quoted as they appear in the app.

7.1 Login screen

- 1 Open `http://127.0.0.1:8000` — you should see the GrantLens login card (Username / Password / Sign in).
- 2 Sign in as `sarah.mitchell / demo-officer-123`.
- 3 Confirm top-right shows Sarah Mitchell and role officer.
- 4 Left sidebar footer should show AI core / RAG status (mock or model name).

7.2 Overview (nav 1)

- 1 Click Overview.
- 2 If mock mode: a yellow MOCK mode banner must be visible.
- 3 Check tiles for queue / review indicators and the small application table at the bottom.
- 4 As manager later: you may also see a Post-audit sampling card with Draw 5 samples.

7.3 Application queue (nav 2)

- 1 Click Application (page title: Application queue).
- 2 Confirm rows such as HS-01, HS-AU-01, HS-AU-02.
- 3 Use the filter box and status dropdown; click + Upload application jumps to Data intake.
- 4 Click a row (or Open) to enter the case screen.

7.4 Case screen — assess and cite

- 1 Open HS-AU-01 (Wine Tourism trap) or HS-01 (NSF demo).
- 2 Read the header fields: Criteria set, Organisation, Scenario, Status.
- 3 If status is new: click Run AI assessment (...) and wait for progress to finish.
- 4 If already assessed: you may use Re-assess.
- 5 Expand a criterion row: check AI draft chip (MET / NOT MET / UNCLEAR / ...), facts list, and the Application quotation.
- 6 Click a fact or quotation — the source panel should highlight the matching passage (verbatim match when citation is good).
- 7 Optional: Run screening (Sanctions) and Run cross-check (document consistency).

7.5 Case screen — human review

- 1 When status is assessed, click Start review (blind spot-check first).
- 2 Complete the spot-check modal if it appears (answer one criterion without seeing the AI draft).
- 3 For each criterion: choose a verdict, fill the reason box when required, then click Confirm this criterion.
- 4 There is no “approve all” button — each line is separate.
- 5 On qualitative MET, you may need attestation: paste a verbatim quote or click I have read and confirm the AI's quotation.
- 6 When all criteria are confirmed, use Sign off as ... in the sign-off card.

7.6 Manager countersignature

- 1 Click Sign out. Sign in as **david.thompson / demo-manager-123**.
- 2 Confirm role chip shows manager.
- 3 Open a case that needs countersignature (adverse / not fully MET path after officer sign-off).
- 4 Use the countersign control and confirm the recorded name is David Thompson.
- 5 If offered, click Draft letter (...) and skim decision / findings / next steps.

7.7 Data intake (nav 6)

- 1 Sign in as officer again. Click Data intake.
- 2 In Upload a new application, confirm the criteria dropdown defaults to AU Demo Fund (marked — default).
- 3 Optionally select NSF 22-586 CAREER (US reference) or another AU fund.
- 4 Fill Applicant / Organisation, choose a .txt/.docx/.pdf or paste text, click Create application.
- 5 You should land on the new case; run assessment as in 7.4.
- 6 On the same page: Sanctions / ABN lookup → enter a name → Look up (hits are evidence only).

7.8 Criteria sets, Bias Lab, Audit log

- 1 Criteria sets (nav 3): change the fund dropdown; read coverage / measurement status. Managers can approve drafts/labels.
- 2 Bias Lab (nav 4): set A = HS-04A, B = HS-04B → Assess & compare.
- 3 Audit log (nav 5): select your case → confirm actor/role match who was signed in; chain status should be healthy.

8. Recommended demo cases

Case id	Criteria set	Why test it
HS-AU-01	au-wine-tourism-r8	AU trap: cellar door claimed vs wholesale-only finances
HS-AU-02	au-onfarm-water	AU trap: cropping farm on grazing rebate; caps
HS-01	nsf-22-586	Clear pass path (NSF demo)
HS-02	nsf-22-586	Clear fail on multiple criteria
HS-04A / HS-04B	nsf-22-586	Bias pair: polished vs plain English
HS-14	nsf-22-586	Multi-document figure mismatch

Table. Cases from data/applications/manifest.json.

9. What “good” looks like

- Cannot act as another role without signing in as that account.
- Citations show verbatim match when the quote exists in the application.
- No silent upgrade to MET without officer confirmation.
- Mock mode shows a MOCK banner; real mode shows the model name in the sidebar.
- Audit events match the signed-in person and role.
- Upload default is AU Demo Fund; NSF CAREER remains selectable.

10. Optional automated checks

From the application root:

```
python tests/test_auth_e2e.py
python tests/test_i18n.py
```

Expect summary lines such as 43 PASS and 35 OK. These do not replace the UI checklist.

11. Common issues

Symptom	Likely cause / fix
Cannot sign in	Use section 5 accounts; or: <code>python -m backend.auth set-password sarah.mitchell demo-officer-123</code>
<code>ModuleNotFoundError: backend</code>	Wrong folder — <code>cd</code> into the directory that contains <code>backend/</code> and <code>README.md</code>
Page will not load	Server not running; start <code>python __start_ollama.py</code> (or mock helper) on port 8000
Assessment / model not ready	Install Ollama, run <code>ollama pull qwen3:8b</code> , keep Ollama open, restart with <code>python __start_ollama.py</code>
Yellow MOCK banner but wanted real AI	You started mock mode — close server and use <code>__start_ollama.py</code> (no <code>GRANTLENS_LLM=mock</code>)
Want a clean demo DB	Stop server, delete <code>data/grantlens.db</code> , restart (manifest cases reseed)
Port already in use	Free port 8000 or use another <code>--port</code> and open that URL

Table. Troubleshooting.

12. Scope notes

- Eligibility assistant — not a full grants-management or payment system.
- Mock figures must not be reported as model performance.
- System diagram: open `docs/System pipeline.html` in a browser.
- Full install detail: `README.md` in the application root.

End of external testing guide — Team AIC026.
